

Hive connection using Generic JDBC

Hongwei Jia

1. Follow below documentation and navigate to the Web UI for creating the Platform Connection

<https://www.ibm.com/docs/en/cloud-paks/cp-data/4.8.x?topic=catalogs-generic-jdbc-connection>

2. Input the JDBC URL:

If you look in the /logs/trace.log of the wdp-connect-connector pod, you should be able to find the JDBC URL that the Hive connector uses. Search for strings containing the words "will connect". That's when the connector pod logs the JDBC connection URL.

Based on the identified JDBC connection URL, add the proper LoginTimeout setting accordingly.

```
jdbc:ibm:hive://p-cdl-knox-prod-  
svc.xxx.net:8443;Database=gold_pxxx;encrypt=false;LoginTimeout=600;QueryTimeo  
ut=600;Database=xxx;Schema=yyy
```

Connection details

JDBC URL (required) ⓘ

`jdbc:ibm:hive://p-cdl-knox-prd-svc.hcscint.net:8443;Database=gold_provider;Login`

JDBC driver class (required) ⓘ

`com.ibm.connect.driver.jdbc.hive.HiveDriver`

JDBC properties ⓘ

`TrustStore=${truststore_file}`
`TrustStorePassword=${truststore_password}`

3. Input the JDBC driver class

Use the Hive driver that CPD already bundle. No need to upload your own driver.

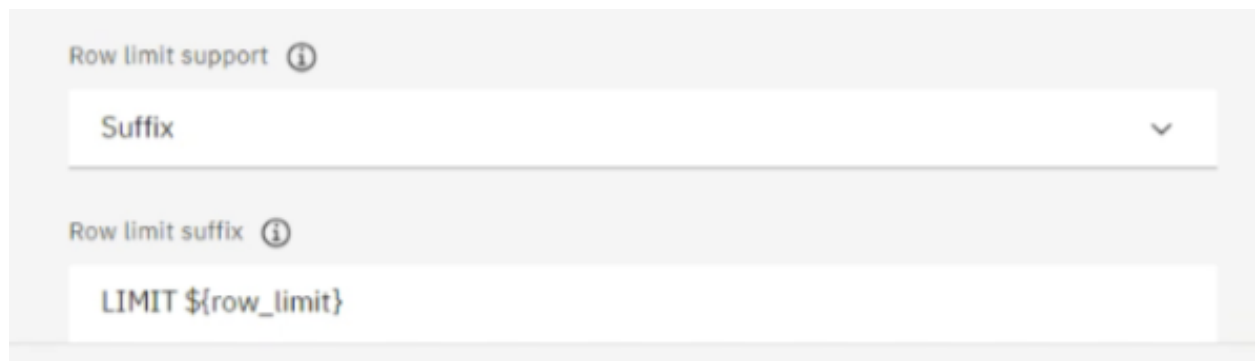

```
com.ibm.connect.driver.jdbc.hive.HiveDriver
```

4.JDBC properties

```
TrustStoreLocation=${truststore_file}  
TrustStorePassword=${truststore_password}
```

5.Row limit

```
Row limit support: Suffix  
Row limit suffix: LIMIT ${row_limit}
```

The screenshot shows a configuration interface with two sections. The first section, titled 'Row limit support' with an information icon, contains a dropdown menu currently set to 'Suffix'. The second section, titled 'Row limit suffix' with an information icon, contains a text input field with the value 'LIMIT \${row_limit}'.

6.Test connection

Validate whether the connection can complete successfully.

7.Save the connection
